Research Profile

Applied ML researcher and Ph.D. candidate at ETH Zurich developing scalable models and data workflows for real-world audio and biological signals. Research spans representation learning, foundation model adaptation, large-scale audio data curation, and generative modeling.

Selected Research

Trajectory Variance for Counterfactual Modeling of Vocal Development

“Trajectory Variance: An Unsupervised Measure of Developmental Vocal Plasticity,” accepted to Interspeech 2026 | Manuscript | Code

- Designed and implemented a PyTorch-based age-conditioned counterfactual model using VAE latent representations and mini-batch optimal-transport matching, with single-forward-pass latent displacement prediction.
- Evaluated on approximately 680K vocalizations across three zebra finches, outperforming Gaussian OT, per-age k-NN, and per-age OT baselines; Cohen’s $d = 0.29$ – 0.57 and AUC = 0.58 – 0.67 after controlling for duration.

Large-Scale Audio Representation Workflow and Human-in-the-Loop Clustering

“Benchmarking Automated and Semi-Automated Vocal Clustering Methods,” Applied Sciences, 2026 | Paper | Code

- Developed a semi-automated workflow using Whisper encoder embeddings, UMAP-based clustering, and interactive expert review to organize real-world vocalization data.
- Achieved ARI = 0.73 and NMI = 0.81 on a 1,454-vocalization benchmark while reducing annotation time by approximately 50% (90 to 45 minutes per bird).
- Applied the workflow to approximately 80,000 hours of recordings for downstream doctoral research.

WhisperSeg: Long-Context Voice Activity Detection for Human and Animal Recordings

“Positive Transfer of the Whisper Speech Transformer to Human and Animal Voice Activity Detection,” ICASSP, 2024 | Paper

- WhisperSeg adapts a pretrained Whisper Transformer for long-context, token-based voice activity detection, generating onset, offset, and vocalization-type tokens directly from audio spectrograms across human and animal recordings.
- Achieved segment-wise F1 = 0.9966 on adult zebra finch recordings and outperformed frame-wise baselines in segment-wise evaluation across all tested datasets, including noisy marmoset and human recordings.
- Developed dataset-processing and baseline-evaluation components for the study, then applied WhisperSeg segmentation outputs in subsequent large-scale vocalization analysis workflows.

Computational Modeling of Vocal Template Formation

“Serial Tutoring Reveals a Composite Song Template,” COSYNE, 2024 | Extended Abstract

- Developed a Bayesian causal-inference model of composite song-template formation from sequential tutoring, fitted to behavioral data from 19 juvenile zebra finches (26 syllables).

Education

ETH Zurich – Ph.D. Candidate, Institute of Neuroinformatics | Apr 2022 – Present; expected early 2027
University of Zurich – M.Sc., Neural Systems and Computation | Feb 2020 – Feb 2022; GPA 5.5/6.0
Korea University – B.S., Computer Science; B.Econ., Statistics | Mar 2014 – Feb 2020; GPA 4.02/4.50

Technical Skills

ML and Generative Modeling: PyTorch, Transformers, Whisper, representation learning, VAEs, flow matching, diffusion models, optimal transport

Audio and Data Workflows: audio segmentation/VAD, learned audio representations, spectrogram analysis, clustering, interactive annotation, large-scale audio processing

Programming and Computing: Python, NumPy/SciPy, scikit-learn, librosa, MATLAB, Git, Linux, HPC, parallel computing, GPU-based batch processing
